

## Introducing Installer, the Plugin

Saturday, February 4th 2006

Time for another plugin. [Installer, the Plugin](#) is probably the most useful plugin you'll ever use . Why? Cause it installs plugin and themes for you with one click! It can install almost any theme and/or plugin out there, and even supports remote file installation. You just paste in the URL of the plugin/theme and it grabs it and installs it.

It's still in "beta" stage so I'm gonna use you as my testers . But right now it is pretty stable. The only catch is that you need to have the correct permission set on the plugins and themes directory for it to work.

Anyway, let me now of any improvements that need to be made wether code-wise or usability-wise.
